Search for Hidden Chambers in the Pyramids

The structure of the Second Pyramid of Giza is determined by cosmic-ray absorption.

Luis W. Alvarez, Jared A. Anderson, F. El Bedwei, James Burkhard, Ahmed Fakhry, Adib Girgis, Amr Goneid, Fikhry Hassan, Dennis Iverson, Gerald Lynch, Zenab Miligy, Ali Hilmy Moussa, Mohammed-Sharkawi, Lauren Yazolino

IL SISTEMA LASER A SCANSIONE

Il sistema laser a scansione è uno strumento che integra quattro unità principali:

- 1) Un laser ranger, il cui raggio viene fatto oscillare normalmente alla direzione di volo
- 2) Un sistema di posizionamento GPS
- 3) Una unità inerziale

- 4) Un computer di bordo per l'acquisizione dei dati

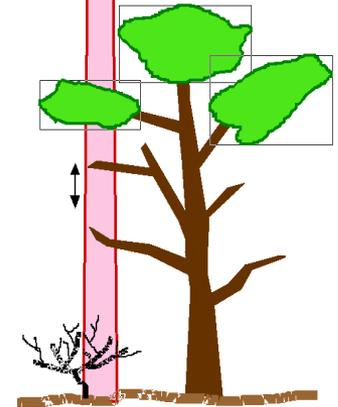

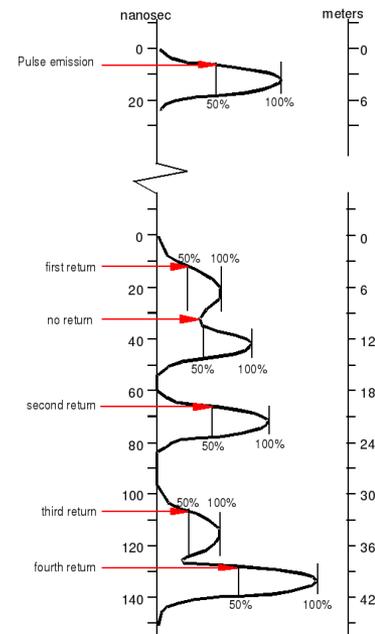

IL SISTEMA LASER A SCANSIONE

Il laser ha un apertura di 0.2 mrad (impronta al suolo di 0.2 m da 1000 m di distanza).

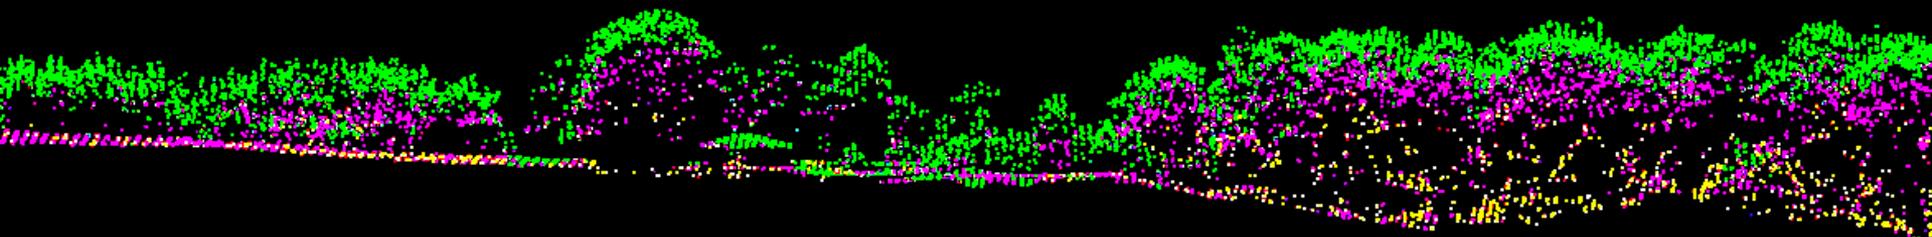

Il sistema registra sia la posizione che la radiometria del primo e dell'ultimo impulso inviato al suolo.

Questo permette di poter penetrare significativamente attraverso la copertura vegetale determinando:

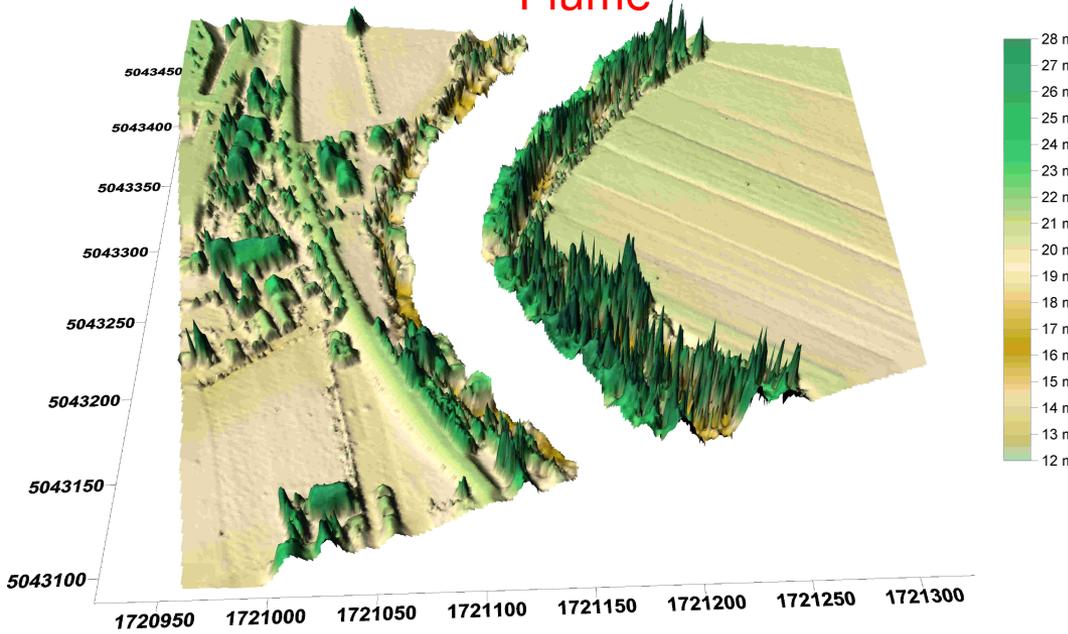

- L'elevazione della vegetazione
- La quota del terreno anche al di sotto della vegetazione.

Claudio Cesare

Da SVETONIO : LE VITE DEI DODICI CESARI

Traduzione di Paolo Del Rosso (frate dom. AD1544)

“Quanto al porto d’Ostia, tiro’ un’ala di muro dalla destra e uno dalla sinistra, ed allo entrare, dove il mare era ancora profondo, tiro’ un molo traverso. E per gittare i fondamenti piu’ gagliardi e stabili affondo’ nel detto luogo la nave, che aveva portato l’obelisco grande d’Egitto, ed accozzati insieme molti pilastri, vi edifico’ sopra una torre altissima, come quella Alessandrina, per tenervi il lume acceso la notte, accio’ che i naviganti conoscessero il cammino.”
